

## Wireless Interactive Native Global Services

Corebridge Wings' solution extends business communications applications to mobile phones, enabling employees to remain always connected. Employees are more accessible and productive while on the move. With Wings, mobile phone users take advantage of unified communications technologies previously reserved to desk phone users.

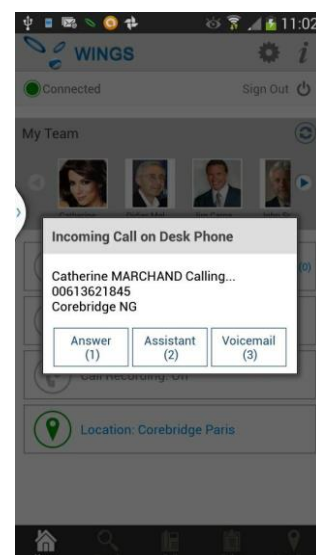

Wings bridges the gap between enterprise and mobile communications. Easy to install and configure, Wings offers freedom to work anywhere, anytime, enhancing productivity, lowering costs, and improving communications across the enterprise.

### Features and Functions

Wings is an ideal solution for mobile users conducting business on the go wherever they are.

#### Stay connected to your office

Wings seamlessly "twins" your mobile phone with your desk phone. With Wings "Twinning" feature, calls received on your office phone are instantly displayed on your mobile (**with caller ID details**) and without ringing your mobile phone (**no roaming charges**). You can then choose to pick-up the landline call on your mobile, transfer it to your assistant or your voice mail.

Twins Notification Message

#### Always available, never disturbed

Wings mobile personal routing offers you the freedom to control calls received on your mobile. By defining personal rules (black list /white list numbers), calls you don't want to be bothered with are redirected to predefined numbers (assistant, voicemail, etc).

#### No more roaming costs

Wings Call By Corebridge feature enables employees to use the enterprise telephony infrastructure to save money on long-distance calls and reduce roaming charges.

By dialing a number, the Corebridge server first initiates a call to your mobile (or to any other phone number you designate), then calls the number and joins the two calls together. Route call traffic at cheaper call rates and avoid roaming charges.

#### Unified call history

Integration of Mobile CDR's with the enterprise PBX call logs provides unified and centralized reporting of all mobile and desktop phone calls in one consolidated view. (No synchronization with device is needed).

## Single full open solution

Wings enables features whatever your Smartphone (Android phone, Iphone, Blackberry and Windows phone 8), whatever the landline telephony infrastructure (Alcatel, Avaya, Cisco, Siemens, etc) and whatever the landline and mobile operator.

## Take your office anywhere

Wings enables sophisticated call handling and Computer Mobile Integration (CMI) allowing mobile phone users to access key Unified Communications benefits previously reserved for PBX desk phone users.

Mobile calls are displayed on your computer with caller ID and screen pop-up from any 3<sup>rd</sup> party application of caller profile.

From Corebridge taskbar, any 3<sup>rd</sup> party applications, such as Microsoft Lync you will be able to dial, answer, hold, un-hold, conference calls, using your mobile phone.

## Send SMS from your PC

Wings "My SMS Gateway" feature enables users an easy way to write SMS messages from windows desktop using the PC keyboard and send them via their own mobile phones.

## Security and Access Rights

Wings provides secure authentication and control of user access rights based on IMEI number, SIM Card ID, data encryption and user identification.

## Wings Locator

Wings Locator enables users' localization and presence detection. Locations coordinates are calculated based on GPS, Wi-Fi, and Cell towers information. Presence is based on the definition of "**Public**" and "**Private**" locations. The Locator detects employees' positions **only** when present at predefined public locations or self-defined private locations. Users maintain control of presence and can associate personal rules based on location detection.

## Benefits

- Improve business continuity, outside the office, regardless mobile phone operating system and company telephony infrastructure.
- Employees are notified in real-time of business.
- Improve accessibility of mobile employees to key customers and colleagues.
- Increase productivity of mobile employees.
- Allow enterprise control of mobile phones usage, presence, activity, and availability.
- Reduce costs and roaming charges.
- Empower users' presence with localization detection and availability.
